You submitted this quiz on **Wed 8 Apr 2015 3:51 AM PDT**. You got a score of **9.00** out of **9.00**.

### Question 1

After applying spatial filtering to an image, you find that the output image looks more blurry than the original image, i.e., some details like sharp edges are lost. Based on this description, the filter applied is most likely to be which of the following types?

Your Answer	Score	Explanation
<input type="radio"/> A high-pass filter		
<input checked="" type="radio"/> A low-pass filter	✓ 1.00	
<input type="radio"/> A band-pass filter		
<input type="radio"/> A band-stop filter		
Total	1.00 / 1.00	

### Question 2

Which one of the following impulse responses acts a high-pass filter?

Your Answer	Score	Explanation
<input type="radio"/>

## Question 3

What is the linear convolution of  $s_1(n_1, n_2)$  and  $s_2(n_1, n_2)$ ?

Your Answer

Score

Explanation

1.00

☐ none of the above.

Total

1.00 / 1.00

## Question 4

A linear shift-invariant system is fully characterizable by its impulse response.

## Question 5

Check all the statements that apply to any linear shift-invariant system  $T$ :

**Your Answer**

**Score**

**Explanation**

☒ If the output to  $x(n_1, n_2) = \delta(n_1, n_2)$  is known, it is

0.25

possible to find the output to any other input.

☒ The output to  $x(n_1, n_2) = e^{j(\omega_1 n_1 + \omega_2 n_2)}$  is always ✓ 0.25  
proportional to the input, i.e.,  $y(n_1, n_2) = C x(n_1, n_2)$  where  $C$  is a complex constant.

☐ It is possible that the zero input (i.e.,  $x(n_1, n_2) = 0$ ) results ✓ 0.25  
in a non-zero output (i.e.,  $y(n_1, n_2) \neq 0$ ).

☐ If  $y(n_1, n_2) = 0$  then  $x(n_1, n_2) = 0$ . ✓ 0.25

Total 1.00 /  
1.00

## Question 6

The regions of support of two images  $x(n_1, n_2)$  and  $y(n_1, n_2)$  are given respectively by

$$\mathcal{S}_x = \{(n_1, n_2) | 0 \leq n_1 \leq P_1 - 1, 0 \leq n_2 \leq P_2 - 1\} \text{ and}$$

$\mathcal{S}_y = \{(n_1, n_2) | 0 \leq n_1 \leq Q_1 - 1, 0 \leq n_2 \leq Q_2 - 1\}$ . Which of the following statements is true regarding the linear convolution of  $x(n_1, n_2)$  and  $y(n_1, n_2)$ , i.e.,

$$z(n_1, n_2) = x(n_1, n_2) \star y(n_1, n_2).$$

Your Answer	Score	Explanation
<input type="radio"/> $z(n_1, n_2)$ is always non-zero over $\mathcal{S}_z = \{(n_1, n_2)   0 \leq n_1 \leq P_1 + Q_1 - 1, 0 \leq n_2 \leq P_2 + Q_2 - 1\}$ .		
<input type="radio"/> $z(n_1, n_2)$ is always non-zero over $\mathcal{S}_z = \{(n_1, n_2)   0 \leq n_1 \leq P_1 + Q_1 - 2, 0 \leq n_2 \leq P_2 + Q_2 - 2\}$ .		
<input type="radio"/> $z(n_1, n_2)$ is always zero outside $\mathcal{S}_z = \{(n_1, n_2)   0 \leq n_1 \leq P_1 + Q_1 - 1, 0 \leq n_2 \leq P_2 + Q_2 - 1\}$ .		
<input checked="" type="radio"/> $z(n_1, n_2)$ is always zero outside $\mathcal{S}_z = \{(n_1, n_2)   0 \leq n_1 \leq P_1 + Q_1 - 2, 0 \leq n_2 \leq P_2 + Q_2 - 2\}$ .	✓ 1.00	
Total	1.00 / 1.00	

## Question 7

In this problem you will implement spatial-domain low-pass filtering using MATLAB, and evaluate the difference between the filtered image and the original image using two quantitative metrics called Mean Squared Error (MSE) and Peak Signal-to-Noise Ratio (PSNR). Given two  $N_1 \times N_2$  images  $x(n_1, n_2)$  and  $y(n_1, n_2)$ , the MSE is computed as

$$MSE = \frac{1}{N_1 N_2} \sum_{n_1=1}^{N_1} \sum_{n_2=1}^{N_2} [x(n_1, n_2) - y(n_1, n_2)]^2.$$

The PSNR is defined as

$$PSNR = 10 \log_{10} \left( \frac{MAX_I^2}{MSE} \right),$$

where  $MAX_I$  is the maximum possible pixel value of the

images. For the 8-bit gray-scale images considered in this problem,  $MAX_I = 255$ . Follow the instructions below to finish this problem. (1) Download the original image from [here](#). The original image is a  $256 \times 256$  8-bit gray-scale image. (2) Convert the original image from type 'uint8' (8-bit integer) to 'double' (real number). (3) Create a  $3 \times 3$  low-pass filter with all coefficients equal to  $1/9$ , i.e., create a  $3 \times 3$  MATLAB array with all elements equal to  $1/9$ . (4) Low-pass filter the original image (converted to type 'double') with the filter created in step (3). This can be done using the built-in MATLAB function "imfilter". The function "imfilter" takes three arguments and returns one output. The first argument is the original image (converted to type 'double'); the second argument is the low-pass filter created in step (3); and the third argument is a string specifying the boundary filtering option. For this problem, use 'replicate' (including the single quotes) for the third argument. The output of the function "imfilter" is the filtered image. (5) Compute and record the PSNR value between the original image (converted to type 'double') and the filtered image by using the formulae given above. (6) Repeat steps (3) through (5) using a  $5 \times 5$  low-pass filter with all coefficients equal to  $1/25$ . Enter the PSNR values you have obtained from your experiments (The PSNR corresponding to  $3 \times 3$  filter first, followed by the PSNR corresponding to  $5 \times 5$  filter). Make sure you order the answers correctly and separate them by a space. Enter the numbers to 2 decimal points.
