

Feedback — Homework 6

[Help Center](#)

You submitted this quiz on **Sun 17 May 2015 7:23 PM PDT**. You got a score of **8.00** out of **8.00**.

Question 1

Applied to a blurred input image, deblurring algorithms A and B result respectively in output images with 20dB and 25dB of ISNR (improvement in signal-to-noise ratio). Which algorithm is better in terms of restored image quality?

Your Answer	Score	Explanation
<input type="radio"/> A		
<input checked="" type="radio"/> B	✓ 1.00	
Total	1.00 / 1.00	

Question 2

Without regularization, we can still solve an image restoration problem and obtain good quality results since the restored image will preserve the fidelity to the data.

Your Answer	Score	Explanation
<input type="radio"/> True		
<input checked="" type="radio"/> False	✓ 1.00	
Total	1.00 / 1.00	

Question 3

In the spatial domain, the out-of-focus effect can be modeled with an LSI system with impulse

response $h(i, j) = \begin{cases} \frac{1}{\pi R^2} & \sqrt{i^2 + j^2} \leq R \\ 0 & \text{otherwise} \end{cases}$. What is the effect of the system on the image in

the frequency domain? Hint: recall that the low-frequency components in an image correspond to the smooth intensity variations, while the high-frequency components correspond to rapid intensity variations, i.e., edges.

Your Answer	Score	Explanation
<input type="radio"/> All frequency components get suppressed.		
<input type="radio"/> None of the above.		
<input type="radio"/> Mainly low frequency components get suppressed.		
<input checked="" type="radio"/> Mainly high frequency components get suppressed.	✓ 1.00	
Total	1.00 / 1.00	

Question 4

In the degradation model $y(i, j) = x(i, j) + n(i, j)$, the noise component $n(i, j)$ consists of uncorrelated entries (i.e., the noise entries at two different locations are not correlated with each other). Regarding the distribution of the noise power in the frequency domain, which of the following statements is true?

Your Answer	Score	Explanation
<input type="radio"/> Higher noise power will appear at high frequencies.		
<input type="radio"/> Higher noise power will appear at low frequencies.		
<input checked="" type="radio"/> Noise power will be uniformly distributed over all frequencies.	✓ 1.00	
<input type="radio"/> More information is needed to answer this question.		

Total	1.00 /
	1.00

Question 5

The spatially adaptive constrained least-squares restoration filter can potentially implement as many different filters as the number of pixels in the image.

Your Answer	Score	Explanation
<input checked="" type="radio"/> True	✓ 1.00	
<input type="radio"/> False		
Total	1.00 / 1.00	

Question 6

This problem pertains to inverse filtering. You should review the corresponding slides in the video lectures to refresh your memory before attempting this problem. To help you understand how inverse filter is implemented and applied, we have provided you with a MATLAB script [here](#). Download the script and the [original image](#), and open the script using MATLAB. Once you open the script, you will see on Line 8 the statement "T = 1e-1". This defines the threshold value used in the inverse filter. The script simulates the blur due to motion and applies inverse filtering for its removal. We encourage you to try different values of the threshold and see how it affects the performance of the inverse filter. We ask you to enter the ISNR value below when the threshold is set to 0.5. Make sure you enter the number with at least 2 decimal points.

You entered:

2.8619

Your Answer	Score	Explanation
2.8619	✓ 3.00
